Serial No. 10/633,935 Monday, December 12, 2005 Page 4

## **LISTING OF CLAIMS:**

- 1. (Currently amended) A gamma camera, comprising:
- a plurality of elongated bar detector strips made of scintillating material, arranged in a stack configuration;
- at least one solid-state photodetector coupled to at least one end of said stack normal to said elongated dimension; and

NDDQ LLP

- a slat collimator including a plurality of elongated slats, for collimating each of said plurality of bar detector strips to receive gamma photons in only a single dimension.
- 2. (Previously presented) A gamma camera as set forth in claim 1, further comprising a plurality of photodetectors each coupled to at least one end of each bar detector strip of said stack.
- (Previously presented) A gamma camera as set forth in claim 2, wherein said photodetectors are silicon drift detectors (SDDs).
- 4. (Previously presented) A gamma camera as set forth in claim 2, wherein said photodetectors are photodiodes.
- 5. (Original) A gamma camera as set forth in claim 1, wherein said bar detector strips are formed of Csl.
- 6. (Cancelled)
- 7. (Original) A gamma camera as set forth in claim 1, wherein each bar detector strip is located between individual slats of said slat collimator.
- 8. (Original) A gamma camera according to claim 7, wherein each of said individual slats has a length matching the length of said bar detector strips.

Serial No. 10/633,935 Monday, December 12, 2005 Page 5

- 9. (Original) A gamma camera as set forth in claim 1, wherein said slat collimator is mounted adjacent to said stack.
- 10. (Original) A gamma camera according to claim 9, wherein each of said individual slats has a length matching the length of said bar detector strips in said stack, and wherein spacing between slats of said slat collimator matches dimensions of said bar detector strips.
- 11. (Currently amended) A gamma camera, comprising:
  - a plurality of elongated bar detector strips made of scintillating material;
- at least one photodetector coupled to an end of each of said bar detector strips normal to said elongated dimension; and
- a slat collimator including a plurality of elongated slats, for collimating each of said plurality of bar detector strips to receive gamma photons in only a single dimension.
- 12. (Previously presented) A gamma camera as set forth in claim 11, wherein said photodetectors are silicon drift detectors (SDDs).
- 13. (Original) A gamma camera as set forth in claim 11, wherein said photodetectors are photodiodes.
- 14. (Original) A gamma camera as set forth in claim 11, wherein said bar detector strips are formed of Csl.
- 15. (Original) A gamma camera as set forth in claim 11, wherein each bar detector strip is located between individual stats of said stat collimator.
- 16. (Cancelled)
- 17. (Cancelled)

Serial No. 10/633,935 Monday, December 12, 2005 Page 6

- 18. (Previously presented) A gamma camera according to claim 15, wherein each of said individual slats has a length matching the length of said bar detector strips.
- 19. (Currently Amended) A method of obtaining tomographic images of an object, comprising the steps of:

obtaining a plurality of sets of planar integral scintillation event data from said object at a plurality of azimuth angles of a rotating scintillation bar detector for each of a plurality of gantry angles of a gamma camera, said scintillation bar detector including a plurality of <u>elongated</u> bar detector strips made of scintillating material; at least one photodetector coupled to an end of each of said bar detector strips normal to said <u>elongated dimension</u>; and

a slat collimator including a plurality of elongated slats, for collimating each of said plurality of bar detector strips to receive gamma photons in only a single dimension; and

reconstructing said plurality of sets of planar integral scintillation event data to form a tomographic image of said object.

## 20. (Cancelled)

- 21. (Previously presented) A gamma camera according to claim 1, further comprising at least a second photodetector coupled to a second end of said stack.
- 22. (Previously presented) A gamma camera according to claim 2, wherein photodetectors are coupled to both ends of each bar detector strip of said stack.
- 23. (Previously presented) A gamma camera as set forth in claim 11, wherein said slat collimator is mounted adjacent to said plurality of bar detector strips.
- 24. (Previously presented) A gamma camera according to claim 23, wherein each of said elongated slats has a length matching the length of said bar detector strips, and

wherein spacing between slats of said slat collimator matches dimensions of said bar detector strips.

25. (Previously presented) A gamma camera according to claim 11, wherein photodetectors are coupled to both ends of each bar detector strip of said stack.
